

THE CLEAR™

WHAT'S IN YOUR CART?

1

High-Quality Plants

Only the highest-quality cannabis plants go into our machines to become The Clear™. Put simply, we don't use material that doesn't meet our standards. It's an expensive choice, but our product is worth it.

Extraction

We use sophisticated extraction techniques to maximize yields of the full cannabinoid profile in each plant. This separates important cannabinoids from the flower we are starting with. No harmful chemicals are involved.

2

Chilled and Purified

Next we "winterize" the mixture by freezing the plant-based fats out using natural, food grade solvents. We use different temperatures and vacuum pressure to separate out the plant compounds—like THC—that we want to keep and get rid of the ones we don't want.

3

Filter and Evaporate

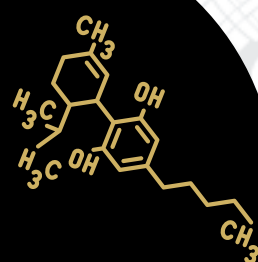

We use filtration to remove the separated plant compounds and material. Then we use an evaporator machine that leaves behind a clean, 'refined' crude oil by taking out the food grade solvent for a full cannabinoid profile.

4

Decarboxylation

We add heat to "activate" the naturally occurring THC-A to convert it to THC, the psychoactive compound in cannabis. It happens at precise temperatures to ensure the cannabinoids don't degrade.

5

Molecular Distillation

We put the clean refined oil into our house-designed and manufactured "still," which takes the cannabis extract and makes it the golden, high potency distillate we use in all of our cartridges.
